Estimation of parameters. For a distribution with unknown parameters, a direct approach to prediction is to estimate the parameters and then use the associated quantile function \hat{F} for example, one could use the sample mean $\hat{\mu}$ as estimate for μ and the sample variance s^2 as an estimate for σ^2 .

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.
